

What I would like to do, is mount my CPE210 in my motorhome, which is easy enough to do and power, then be able to access it **wirelessly** and select the wifi network to which I want it to connect, then share this internet connection with my devices.

I have been able to bridge the connections, but then I cannot access the CPE210's settings wirelessly.

I've googled high and low, and tried so many combinations of settings I've lost track, and advice welcome! Thanks v much
